

HygienaClad - Tiles vs Whiterock

Independent research carried out by Altro has shown that the real cost of Installing Whiterock over a 20 year period is significantly more cost effective than traditional tiling. The cost analysis took into account (Original walling material / Installation / Cleaning & Maintenance / Disposal / Replacement / level of use). The research did not take into account the benefits of having a fully bonded walling material that provides a finish that is resilient and maintains its finish over its life. The figure below clearly demonstrates that the cleaning element of Whiterock is significantly less due to not having the issue of cleaning the grout between the tiles.

Life cycle cost calculation

The life cycle cost analysis is based around the current government discount rate of 6% as used in Private Finance Initiatives. Original material cost based upon trade prices and installation costs based upon standard industry costs. Cleaning materials and labour costs were based on an assumed national average.
